

We're investing in watershed  
science for future generations.

# That's our promise.

At Mosaic, our nearly 4,000 Florida employees understand that watersheds are the lifeblood of our drinking water supply, estuaries and coastal economies. In planning our phosphate operations, we use state-of-the-art technology and hydrology modelling to verify how surface and groundwater flows before, during and after mining. Working with regulators, we can design reclaimed landscapes that provide flow to preserved floodplains — thereby replenishing flows that may have been impacted decades before mining.
